Bioinformation

Gene Symbol	TSPAN8
Gene Full Name	tetraspanin 8
Background	The protein encoded by this gene is a member of the transmembrane 4 superfamily, also known as the tetraspanin family. Most of these members are cell-surface proteins that are characterized by the presence of four hydrophobic domains. The proteins mediate signal transduction events that play a role in the regulation of cell development, activation, growth and motility. This encoded protein is a cell surface glycoprotein that is known to complex with integrins. This gene is expressed in different carcinomas. The use of alternate polyadenylation sites has been found for this gene. [provided by RefSeq, Jul 2008]
Calculated Mw	26 kDa
Cellular Localization	Membrane; Multi-pass membrane protein. [UniProt]
