## Bioinformation

Gene Symbol	BMP1
Gene Full Name	bone morphogenetic protein 1
Background	This gene encodes a protein that is capable of inducing formation of cartilage in vivo. Although other bone morphogenetic proteins are members of the TGF-beta superfamily, this gene encodes a protein that is not closely related to other known growth factors. This gene is expressed as alternatively spliced variants that share an N-terminal protease domain but differ in their C-terminal region. [provided by RefSeq, Aug 2008]
Function	Cleaves the C-terminal propeptides of procollagen I, II and III. Induces cartilage and bone formation. May participate in dorsoventral patterning during early development by cleaving chordin (CHRD). Responsible for the proteolytic activation of lysyl oxidase LOX. [UniProt]
Calculated Mw	111 kDa (Human)
PTM	Proteolytically activated in the trans-Golgi network by furin-like/paired basic proprotein convertases, cleavage is not required for secretion. [UniProt]
Cellular Localization	Golgi apparatus, trans-Golgi network. Secreted, extracellular space, extracellular matrix. Note=Co-localizes with POSTN in the Golgi. [UniProt]
