## **Bioinformation**

Gene Symbol	WFS1
Gene Full Name	Wolframin ER Transmembrane Glycoprotein
Background	This gene encodes a transmembrane protein, which is located primarily in the endoplasmic reticulum and ubiquitously expressed with highest levels in brain, pancreas, heart, and insulinoma beta-cell lines. Mutations in this gene are associated with Wolfram syndrome, also called DIDMOAD (Diabetes Insipidus, Diabetes Mellitus, Optic Atrophy, and Deafness), an autosomal recessive disorder. The disease affects the brain and central nervous system. Mutations in this gene can also cause autosomal dominant deafness 6 (DFNA6), also known as DFNA14 or DFNA38. Alternatively spliced transcript variants have been found for this gene. [provided by RefSeq, Mar 2009]
Function	Participates in the regulation of cellular Ca2+ homeostasis, at least partly, by modulating the filling state of the endoplasmic reticulum Ca2+ store. [UniProt]
Calculated Mw	100 kDa
PTM	Acetylation; Glycoprotein; Phosphoprotein. [UniProt]
Cellular Localization	Cytoplasmic vesicle; Endoplasmic reticulum; Membrane. [UniProt]
