Swiss-port # P49918 Human

Gene Symbol CDKN1C

Gene Full Name cyclin-dependent kinase inhibitor 1C (p57, Kip2)

Background This gene is imprinted, with preferential expression of the maternal allele. The encoded protein is a

tight-binding, strong inhibitor of several G1 cyclin/Cdk complexes and a negative regulator of cell proliferation. Mutations in this gene are implicated in sporadic cancers and Beckwith-Wiedemann syndorome, suggesting that this gene is a tumor suppressor candidate. Three transcript variants encoding two different isoforms have been found for this gene. [provided by RefSeq, Oct 2010]

Function Potent tight-binding inhibitor of several G1 cyclin/CDK complexes (cyclin E-CDK2, cyclin D2-CDK4, and

cyclin A-CDK2) and, to lesser extent, of the mitotic cyclin B-CDC2. Negative regulator of cell

proliferation. May play a role in maintenance of the non-proliferative state throughout life. [UniProt]

Research Area Cancer antibody; Cell Biology and Cellular Response antibody; Gene Regulation antibody
