Bioinformation

Gene Symbol	ANGPTL3
Gene Full Name	angiopoietin-like 3
Background	This gene encodes a member of a family of secreted proteins that function in angiogenesis. The encoded protein, which is expressed predominantly in the liver, is further processed into an N-terminal coiled-coil domain-containing chain and a C-terminal fibrinogen chain. The N-terminal chain is important for lipid metabolism, while the C-terminal chain may be involved in angiogenesis. Mutations in this gene cause familial hypobetalipoproteinemia type 2. PTM	O-glycosylated at Thr-226 by GALNT2; blocks processing and activation by proprotein convertases.  In part proteolytically cleaved by proprotein convertases; proposed to be involved in activation. [UniProt]
