Bioinformation

Gene Symbol	SEMA6C
Gene Full Name	sema domain, transmembrane domain (TM), and cytoplasmic domain, (semaphorin) 6C
Background	This gene encodes a member of the semaphorin family. Semaphorins represent important molecular signals controlling multiple aspects of the cellular response that follows CNS injury, and thus may play an important role in neural regeneration. [provided by RefSeq, May 2010]
Function	Shows growth cone collapsing activity on dorsal root ganglion (DRG) neurons in vitro. May be a stop signal for the DRG neurons in their target areas, and possibly also for other neurons. May also be involved in the maintenance and remodeling of neuronal connections. [UniProt]
